**Introduction**

The lacy juvenile leaves of false aralia are made up of 7 to 10 slender, jagged leaflets arranged like fingers of a hand (Fig. 1). They are coppery in color when they unfold but then become a very dark grey-green. The mature foliage looks entirely different and is heavier with broader leaflets, giving a coarser silhouette. Both types of leaves can be present on the plant at the same time.

**General Information**

**Scientific name:** Dizygotheca elegantissima  
**Pronunciation:** diz-zee-go-THEEK-uh el-uh-gan-TISS-sim-uh

Light requirement: plant grows in part shade/part sun; plant grows in the shade
Soil tolerances: slightly alkaline; clay; sand; acidic; loam
Drought tolerance: high
Soil salt tolerances: poor
Plant spacing: not applicable

Other

Roots: usually not a problem
Winter interest: no special winter interest
Outstanding plant: not particularly outstanding
Invasive potential: not known to be invasive
Pest resistance: long-term health usually not affected by pests
Use and Management

False aralia provides a tropical look as a house plant indoors or in outdoor settings, whether in containers or at entranceways where its distinctive foliage casts interesting shadows on background walls. It can be pruned to develop into a small tree. Due to its upright vertical habit, false aralia is best used as an accent or specimen plant.

This somewhat branched, small evergreen tree will tolerate bright light, performing best in light shade. False aralia needs fertile, well-drained soil and protection from strong winds to develop into a nice specimen.

Propagation is by air-layering, cuttings, or seed.

Nematodes are a problem in the soil, while mites and scale can be serious leaf problems.

Pests and Diseases

No diseases are of major concern.
