Opuntia spp.  
Edward F. Gilman

Introduction

Prickly Pear Cactus is a plant that varies a great deal in height (1 to 20 feet), depending upon the species. It forms irregular clumps or shrub-like mounds and has a very coarse texture. The leaves of Prickly Pear Cactus are inconspicuous, however the plate-like sections of the stem are often thought of as leaves. These plate-like sections are actually modified stems and reach a length of 2 to 6 inches. Stem sections remain green with age and are covered with 3-inch-long spines. Very minute spines (glochids) are located in the numerous areoles. The larger spines are quite painful, however the minute spines cause a lot of irritation if they are captured in clothing or attach onto the skin surface.

General Information

Scientific name: Opuntia spp.
Pronunciation: oh-PUN-shee-uh species
Common name(s): Prickly-Pear Cactus
Family: Cactaceae
Plant type: shrub
USDA hardiness zones: 3B through 11 (Fig. 1)
Planting month for zone 7: year round
Planting month for zone 8: year round
Planting month for zone 9: year round
Planting month for zone 10 and 11: year round
Origin: native to Florida
Uses: mass planting; border
Availability: somewhat available, may have to go out of the region to find the plant

Description

Height: 3 to 20 feet
Spread: 3 to 15 feet
Plant habit: spreading; upright
Plant density: open
Growth rate: moderate
Texture: coarse

Foliage

Leaf arrangement: alternate
Leaf type: simple
Leaf margin: entire
Leaf shape: elliptic (oval)
Leaf venation: none, or difficult to see
Leaf type and persistence: deciduous
Leaf blade length: less than 2 inches
Leaf color: green
Fall color: no fall color change
Fall characteristic: not showy

Flower

Flower color: orange; red; purple; white
Flower characteristic: summer flowering

Fruit

Fruit shape: oval
Fruit length: 1 to 3 inches
Fruit cover: fleshy
**Figure 1.** Shaded area represents potential planting range.

**Fruit color:** purple  
**Fruit characteristic:** suited for human consumption; persists on the plant

**Trunk and Branches**

- **Trunk/bark/branches:** showy; thorns present  
- **Current year stem/twig color:** green  
- **Current year stem/twig thickness:** very thick

**Culture**

- **Light requirement:** plant grows in full sun  
- **Soil tolerances:** sand; acidic; slightly alkaline; loam  
- **Drought tolerance:** high  
- **Soil salt tolerances:** good  
- **Plant spacing:** 24 to 36 inches

**Other**

- **Roots:** usually not a problem  
- **Winter interest:** no special winter interest  
- **Outstanding plant:** plant has outstanding ornamental features and could be planted more  
- **Invasive potential:** not known to be invasive  
- **Pest resistance:** no serious pests are normally seen on the plant

**Use and Management**

When the flowers of this plant are produced in large numbers, as on vigorously growing individuals, they put on quite a show. The plant will bloom over a period of several weeks, however the individual flowers only last one day. The flowers are cup-shaped, yellow to orange or red, appear on the outermost plate-like stem sections, and are 2 to 3 inches wide. The showy berries may reach a length of 2 to 3 inches and are red to purple at maturity (mid to late summer). These fruits may be eaten after the spines and glochids have been singed off with fire, and the seeds of the fruits can be roasted for flour.

These plants are well-suited to hot, dry conditions. Prickly Pear Cactus is commonly used as a specimen and border plant.
in areas where it is not an inconvenience to passersby. It is also well adapted to seaside and rocky locations. An established row of these makes an impenetrable border for pedestrians.

Prickly Pear Cactus is native to the southern United States, and quite a few species are native to Florida. This plant is drought and heat tolerant. It requires a sunny, well-drained site and is tolerant of sandy, alkaline soils. Prickly Pear will only tolerate wet conditions for a very short period of time.

Propagation is by division because the seeds of many species are difficult to germinate. The plate-like sections can be placed on slightly moist sand to obtain rooting.

**Pests and Diseases**

Opuntia spp. have no pests nor diseases of great concern. Root rot can be a problem in wet locations.
