Plumbago auriculata

Edward F. Gilman

Introduction

This sprawling, mounding, somewhat vine-like, evergreen shrub is quite outstanding because it is covered most of the year with clusters of pale blue, phlox-like flowers (Fig. 1). Plumbago is excellent as a foundation planting, or when used in planters. It will cascade down a retaining wall, showing off the unusual blue flowers. It has also been sheared into a hedge but most of the flowers are removed at each pruning.

Use and Management

Needing full sun for best growth and flowering, Plumbago will grow on any fertile, well-drained soil, becoming drought-tolerant once established. Leaves may yellow on soils with a high pH, indicating mineral-deficiency. Plumbago responds well to an application or two of fertilizer during the growing season to encourage continuous growth and flowering. Excessive growth can be removed at any time of year.

Plants in north-central Florida quickly recover in the spring following a killing freeze. Allow four to six feet between plants in a mass planting so the natural cascading, fountain shape develops. Plumbago also looks attractive as a specimen if located in a low ground cover.

The variety ‘Alba’ has white flowers.

Propagation is by seed, cuttings, or division.

Pest problems include cottony cushion scale and mites.
